 i-CAT is developing a range of Operating Systems to dynamically manifest data as experience in order to enhance perspectives on a complex world. The Operating Systems project explores data as an abstract and malleable material that generates a dynamic mirror image of our biological, ecological and social activities.

The Operating Systems project proposes a range of tools and interfaces that have the potential to enhance our ability to perceive and archive the mirror world. The stations with the range of Operating Systems outlined on this site is to make the data generated by human and ecological activity tangible and readily available to the public, artists, engineers and scientists.

Underpinning these Operating Systems is the understanding that the material for manifesting things that lie outside of our normal frames of reference is 'data' - things so far away, so close, so massive, so small and so all-encompassing.
